Water observations are collected by park visitors and volunteers. Check with park staff for latest information.

Have a water observation to report? Send updates to Daniel Lewis at danlewis@yahoo.com

For more information on spring development and maintenance see Bill Levey's website, <http://www.wlevey.com/coepark/>

Notes:

Water availability is taken very literally. It could be a flowing spring oasis or a mud hole or stagnant pool. Don't rely upon a single source, consider alternate sites as a backup.

Ponds and Lakes: Many of the smaller ponds can dry up quickly. Water level is the relative percentage of being full, measured to the spillway. A water level of '1' indicates mud only. A water level of '0' indicates it is dry.

Springs: Not all springs shown on the park map are developed or marked. Some springs have flow valves so water may not flow continuously. Many springs have troughs for horses. Wa level indicates the trough's relative percentage of being full. A water level of '0' or 'blank' indicates either no trough available or dry.

Creeks: Water levels above knee-high are considered non-crossable. Use extreme care when crossing creeks. Consider weather conditions: you may not be able to return.

GPS: UTM-East and UTM-North are the approximate GPS coordinates using the UTM UPS grid and the WGS 84 map datum. Ponds are measured at the mid-point of the dam.

Bury human waste and wash dishes at least 100 feet from streams, lakes, and springs.

Purify all backcountry water that you intend to consume.
